Client Organization/Partners Arction Oy			
<p><b>Abstract</b></p> <p>Arction Oy is a Finnish software company, based in Kuopio. Their main product is LightningChart, the fastest C# framework for visualisation of scientific, engineering, trading and research data. The library contains bunch of tools for visualisation of XY graph, 3D XYZ, smith, polar, 3D pie/donut views and 3D objects.</p> <p>The company wanted to extend the LightningChart's abilities of polygonal 3D models rendering by volume rendering. It gives Arction an opportunity to attract new clients to the product. In result the framework provides an unique possibility to render volume and polygonal models at same visualisation.</p> <p>The project started from a literature research and comparing of different volume visualisation techniques, to choose the best one for the Arction's case and implement it inside the framework. The implementation of the volume rendering engine is based on DirectX used together with C# via SharpDX API and HLSL shader language for low level optimisation of rendering calculations.</p> <p>The final chapter of the report contains an evaluation of the results and suggestion for a future development of the engine.</p>			
<p><b>Keywords</b></p> <p>Visualisation, Ray Casting, 3D, C#, LightningChart, DirectX, HLSL, Image Processing, Volume Rendering, Rendering</p>			

## ACKNOWLEDGEMENTS

I am very thankful to Action Oy for offering me an opportunity to take part at development of the project. I really like the office atmosphere and freedom in terms of my working style and schedule allowed by the company.

My special thanks go to Mr. Pasi Toummainen, CEO of the company, who expressed interest to my idea to extend the library by the volume rendering engine, gave me permission to work on the project and guided me especially at very early part of the development process.

Moreover, I would like to say thank you to my thesis supervisor, Arto Toppinen, for his mentoring and support during the report writing stage of my work.

In addition I would like to express my deepest gratitude Karlsruhe Institute of Technology, there I got the first experience with volume rendering via ray casting. I am especially grateful to Nicolas Tan Jerome, who was my mentor during the part of my internship related to modification of TomorayCaster 2 and to Aleksandr Lizin, the creator of the WebGL volume rendering engine.

# Chapter 1

## Introduction

### 1.1 Motivation

Volume data is very common our day. An importance of the type of datasets will grow in nearest future, because of development of field of 3D data acquisition and possibilities to perform the visualisations on modern office workstation with an interactive frame rate.

Volume rendering is a process of multi-dimensional data visualisation into two-dimensional image which gives observer an opportunity to recognise meaningful insights in the original information. The technology allows us to represent 3 dimensions of the data via position in a 3D space and 3 more via color of the point.

The dataset can be captured by various number of technologies like: MRI<sup>1</sup>, CT<sup>2</sup>, PET<sup>3</sup>, or USCT<sup>4</sup>. They also can be produced by physical simulations, especially for fluid dynamics. Volumetric information plays a big role in medicine for an advanced cancer detection, visualization of aneurisms and treatment planning. This kind of rendering is also very useful for nondestructive material testing via computer tomography or ultrasound. Geoseismic researches produce huge three-dimensional datasets need to be visualised. They are used to an oil exploration and planning of the deposit development.

<sup>2</sup>Computer tomography

<sup>3</sup>Positron emission tomography

<sup>4</sup>Ultrasound computer tomography

## 1.2 Personal background

I recieved my first expirince in visualisation of volumetric data during my internship at Institute of Data Processing and Electronics, which belongs to the Karlsruhe Institute of Technology (KIT). I was a part of the 3D Ultrasound Computer Tomography (USCT) team. Thier main goal is development of a new imaging methodology for early breast cancer detection. During the work placement I had to develop an algorithm to visualise five-dimensional datasets. In result the algorithm was integrated into Tomoraycaster 2<sup>5</sup> and USCT's edition of DICOM Viewer.

Figure 1.1: Volume visualisation of breast phantome made by USCT

On the project I made my very first steps in modern computer graphics. I got my first expirince in work with WebGL during custimisation of the Tomoraycater, learned GLSL, my first shader languag, I also gained a lot of knowledge about image processing and scintific data visualisation, which became the basis for my thesis work.

## 1.3 Arction Oy and Ligthning Chart

Arction Oy is Finnish software company based in Kuopio. Thier team has a strong background in computer graphics and science. The main product of company called LightningChart Ultimate.

---

<sup>5</sup>JavaScript framework for visualisation of 3D data, developed in Institute of Data Processing and Electronics

It is the fastest C# library for scientific and engineering data visualisation. The library is capable to draw massive XY, Polar, Smith and 3D XYZ graphs, polygonal meshmodels, surfasec, 3D pies/donuts and Geographic information. The library has an API for .NET WinForm and WPF applications, it is also possible to use it for a traditional Win32 C++ software development. The main advantage of library is the fact that it is based on low-level DirectX graphics routines developed by Arction, then the most part of competitors use System.Windows.Media graphics routines.

Figure 1.2: Example of Lightning Chart possibilities from the main page of Arction

## 1.4 Project Goals

So, as you can conclude from previous section, Lightning Chart is very advanced software for 3D rendering based on polygons and lines and I came up with an idea to extend it by special rendering engine for visualisation of volumetric data. It will give Arction's clients unique possibilities to combine visualisation of volume datasets with a wide range of other 3D possibilities of the library.

The rendering engine must be able:

- to render large multi-dimensional volumes with an interactive frame rate.
- to move and rotate the model in the chart's space.
- to provide client with possibilities to apply windowing and thresholding to the initial dataset.
- to render the model semi-transparently.

Basically, this tool will give end user possibilities to change contrast and brightness of the model's visualisation for better recognition of tiny details and make areas, which are out of certain range totally, transparent, it will also reveal insights in the internal structure of the model to the user via semi-transparency.
